~~Combination Circuits. As mentioned in the previous section of Lesson 4, two or more electrical devices in a circuit can be connected by series connections or by parallel connections. When all the devices are connected using series connections, the circuit is referred to as a series circuit. In a series circuit, each device is connected in a manner such that there is only one pathway by which charge can traverse the external circuit.~~

~~An electric circuit is a collection of electrical devices, called circuit elements connected by conductors in a closed path (i.e., in a complete loop). Circuit elements include, source of electrical energy (e.g. battery), sink of electrical energy (e.g. light bulb), and switch to complete or break the circuit.~~

~~Passive circuit Elements. Passive Elements can be defined as elements which can control the flow of electrons through them.They either increase or decrease the voltage. Here are some examples of~~

passive elements. Resistor: A resistor opposes the flow of current through it. For a linear circuit, Ohm's law is applicable, which states that voltage across the resistor is directly proportional to the current flowing through it, the proportional constant being the resistance.

Circuit (b) is the brightest; the batteries are pointing in the same direction. Circuit (c) is the dimmest; the bulb will not light at all. Circuits (a) and (d) are of the same brightness; in circuit (d) two of the batteries are connected in the same direction, whilst the third is facing in the opposite direction.

An RLC series circuit is a resistor, capacitor, and inductor series combination across an ac source. The same current flows through each element of an RLC series circuit at all points in time. The counterpart of resistance in a dc circuit is impedance, which measures the combined effect of resistors, capacitors, and inductors.

In a series circuit, current is the same everywhere. $I_s = I_1 = I_2 = I_3 = \dots = I_n$. In a series circuit, voltage divides so that the voltage increase supplied by the voltage source equals the sum of the voltage drops across the resistors. $V_s = V_1 + V_2 + V_3 + \dots = \sum V_n$. In a series circuit, the total resistance equals the sum of the individual resistances.

Active and passive components form the two main types of electronic circuit elements. An active component supplies energy to an electric circuit, and hence has the ability to electrically control the flow of charge. A passive component can only receive energy, which it can either dissipate or absorb. Types of Electronic Components
